0 1 Executive Summary

Bridge is a workflow-driven healthcare revenue recovery platform designed to optimize the identification, assignment, management, and resolution of underpayment and recovery opportunities at scale. The platform serves as both a centralized operational workspace and an intelligent workflow orchestration engine, enabling healthcare organizations to efficiently process large volumes of claims through automation, configurable business logic, and operational decisioning.

The platform ingests claim, payer, and operational data from multiple sources, applies rules-based and machine learning-driven logic to identify opportunities, and orchestrates work distribution, prioritization, follow-up, and resolution activities across operational teams. By combining automation, intelligent routing, standardized workflows, and scalable user experiences, Bridge improves recovery outcomes, increases operational efficiency, and supports rapid organizational scale.

For valuation purposes, Bridge's primary value drivers include its ability to maximize revenue recovery, automate operational workflows, improve analyst productivity, reduce manual effort, provide enterprise-wide visibility into work execution, and support scalable growth through configurable platform capabilities.

0 2 System Overview

Bridge is designed to manage the lifecycle of healthcare revenue recovery opportunities from identification through resolution. The platform supports high-volume operational workflows focused on underpayments, denials, appeals, pricing discrepancies, and related recovery initiatives.

The system centralizes operational activities into a unified platform that enables:

- Claim and opportunity intake
- Workflow orchestration
- Intelligent work assignment
- Analyst productivity management
- Rules-based decisioning
- Follow-up and escalation management
- Payment and resolution tracking
- Operational reporting and analytics

Bridge supports both automated and analyst-driven workflows, allowing organizations to balance scale, compliance, operational complexity, and recovery optimization.

0 3 Workflow Engine & Activities

Bridge operates as an activity-driven workflow and operational orchestration platform. Activities represent structured units of work assigned to users, teams, or automated processes.

K E Y C H A R A C T E R I S T I C S

Activities drive progression across operational workflows.

Structured queues and prioritized worklists for analysts.

Real-time status and full activity history for visibility.

Dynamic assignment via configurable routing logic.

Automated triggers initiate downstream workflows and actions.

Standardization & auditability across large recovery orgs.

This design enables standardization, scalability, auditability, and operational consistency across large recovery organizations.

0 4 End-to-End Operational Workflow

The Bridge platform orchestrates a continuous five-stage operational workflow — from initial data arrival through final resolution. Each stage embeds automation and decision intelligence, while preserving full visibility and auditability across the lifecycle.

3.1 Intake & Opportunity Identification

The Intake & Opportunity Identification stage serves as the entry point and intelligence layer of the Bridge platform, where incoming operational and claims data is transformed into actionable recovery opportunities. The platform ingests data from multiple internal and external sources, standardizes and enriches the data, and applies configurable business rules, machine learning models, and analytical logic to identify potential recovery opportunities.

Bridge supports automated classification, segmentation, and prioritization of opportunities based on factors such as financial impact, recovery probability, operational complexity, client-specific rules, payer characteristics, and regulatory considerations. This stage improves operational efficiency, increases identification rates, and ensures downstream workflows begin with complete and prioritized information.

KEY FUNCTIONAL CAPABILITIES

- | | |
|--|---|
| 01 Multi-source data ingestion and normalization | 02 Automated opportunity identification |
| 03 Rules-based and ML-driven classification | 04 Data enrichment and transformation |
| 05 Intelligent prioritization and scoring | 06 Workflow routing via assignment engine |
| 07 Queue generation and workload balancing | |

3.2 Assignment & Workflow Orchestration

The Assignment & Workflow Orchestration stage manages how work is distributed, prioritized, and progressed throughout the organization. Bridge dynamically routes work based on configurable operational logic — including user skill level, claim complexity, financial thresholds, client-specific rules, department ownership, onshore/offshore restrictions, and capacity balancing — and continuously evaluates workloads and operational conditions to optimize assignment decisions and improve throughput.

This stage serves as a critical operational efficiency driver by reducing manual assignment effort, improving workload distribution, and maximizing analyst productivity.

KEY FUNCTIONAL CAPABILITIES

- | | |
|---|---|
| 01 Dynamic work assignment and redistribution | 02 Intelligent queue management |
| 03 Role-based workflow routing | 04 Supervisor reassignment capabilities |
| 05 Threshold-based prioritization | 06 Automated activity triggering |
| 07 SLA and aging management | |

3.3 Analyst Workflow & Investigation

The Analyst Workflow & Investigation stage is the primary operational execution layer within Bridge. During this phase, analysts review opportunities, validate claim and payer information, document findings, and execute recovery workflows based on platform-guided next steps.

Bridge provides analysts with centralized visibility into claim history, operational activities, payer interactions, supporting documentation, workflow status, and recommended actions. The platform standardizes operational execution through configurable workflows, guided actions, and embedded business logic.

VALUATION IMPACT

From a valuation perspective, this stage directly drives **increased analyst productivity, improved recovery outcomes, reduced operational variability, and faster resolution timelines.**

KEY FUNCTIONAL CAPABILITIES

- | | |
|---|--|
| 01 Structured analyst workspaces | 02 Centralized claim and activity visibility |
| 03 Guided workflows and decision support | 04 Documentation and audit tracking |
| 05 Activity management and escalation workflows | 06 Operational status tracking |
| 07 Integration with external systems and data sources | |

3.4 Automation & Decision Intelligence

Bridge incorporates automation and decision intelligence throughout the operational lifecycle to reduce manual effort and improve consistency. The platform leverages configurable rules engines, workflow automation, machine learning models, and intelligent assignment logic to automate repetitive operational processes and support decision-making at scale.

Automation capabilities span opportunity identification, workflow triggering, assignment logic, follow-up scheduling, queue prioritization, routing and reassignment, data enrichment, and operational alerts and notifications.

VALUATION IMPACT

From a valuation perspective, this stage drives **reduced operational costs, increased scalability, faster processing timelines, and consistent execution across teams.**

KEY FUNCTIONAL CAPABILITIES

- | | |
|---|-------------------------------------|
| 01 Rules-based workflow automation | 02 Dynamic assignment engine |
| 03 Machine-learning-driven prioritization | 04 Automated queue generation |
| 05 Intelligent routing and escalation | 06 Real-time operational monitoring |
| 07 API and system integrations | |

3.5 Follow-Up & Resolution Management

The Follow-Up & Resolution Management stage ensures opportunities are actively managed through to completion. Bridge schedules and orchestrates structured follow-up activities, tracks operational progress, manages escalations, and ensures that no recovery opportunity is left unattended.

The platform maintains full operational visibility and auditability throughout the lifecycle while supporting standardized workflows for issue resolution and claim closure.

VALUATION IMPACT

From a valuation perspective, this stage drives **improved cash realization, reduced aging of unresolved opportunities, higher completion and recovery rates**, and **increased operational accountability**.

KEY FUNCTIONAL CAPABILITIES

- | | |
|--------------------------------------|---|
| 01 Automated follow-up scheduling | 02 Workflow progression management |
| 03 Escalation and exception handling | 04 Activity and status tracking |
| 05 Resolution workflows | 06 Operational reporting and visibility |
| 07 Structured closure processes | |

0 5 Operational Model

Bridge supports multiple operational teams and workflows within a unified platform architecture. The platform enables organizations to standardize operational execution, scale across departments and clients, balance workloads dynamically, support specialized operational workflows, enforce compliance and business rules, and optimize analyst productivity.

Bridge incorporates configurable assignment and routing logic that governs how work is distributed across teams based on claim characteristics, client requirements, user roles and permissions, recovery thresholds, operational priorities, and compliance requirements.

This flexible operating model allows organizations to optimize both efficiency and recovery performance while maintaining centralized visibility and governance.

06 Platform Architecture & Technology

Bridge is a scalable operational platform that combines workflow orchestration, automation, configurable business logic, and modernized user experiences to support high-volume healthcare revenue recovery operations.

The platform integrates data ingestion pipelines, workflow engines, assignment logic, reporting frameworks, and operational tooling into a centralized ecosystem designed for scale and operational efficiency.

CORE ARCHITECTURAL CAPABILITIES

- | | |
|--|--|
| 01 Configurable workflow orchestration | 02 Dynamic assignment engine |
| 03 Rules-based decisioning | 04 Machine-learning integration |
| 05 API-based integrations | 06 Operational reporting and analytics |
| 07 Real-time activity tracking | 08 Modernized UI and user workflows |

Automation and intelligent orchestration are embedded throughout the platform to support operational scale without requiring linear increases in staffing.

ARCHITECTURAL VALUE

From a valuation perspective, this architecture enables **scalable operational growth, reduced manual effort, increased analyst efficiency, rapid onboarding of workflows and clients**, and **flexibility for future platform expansion**.

Bridge translates architectural depth into operational reach – a single platform that scales with the work, **not the headcount**.

07 Key Value Drivers

Bridge's value to a healthcare organization concentrates in seven measurable areas — each tied to operational outcomes and platform capabilities described in this brief.

01	Revenue Optimization	Identifies and prioritizes high-value recovery opportunities through automation and intelligent decisioning.
02	Workflow Efficiency	Standardized workflows and automation reduce operational overhead and improve throughput.
03	Operational Intelligence	Rules-based and ML-driven logic improve assignment accuracy, prioritization, and execution consistency.
04	Productivity Enhancement	Centralized workflows and modernized user experiences improve analyst efficiency and effectiveness.
05	Transparency & Governance	End-to-end operational visibility enables tracking, accountability, and performance measurement.
06	Scalability	Supports high-volume operational growth through configurable workflows, automation, and intelligent routing.
07	Platform Flexibility	Adaptable architecture enables support for evolving workflows, operational models, and future integrations.

Bridge. A platform built to recover more — faster, more accurately, and at scale.
